

SYMBIO CASE STUDY

The Effect of Symbio MycoForce Seed Coat on “Gardeners Delight” Tomatoes

By Johanne Shannon-Lowe, University of Surrey

All the plants were grown from seed sown on 23rd March. The treated plants had Symbio MycoForce Seed Coat applied at seeding and the control plants had full rate slow release Osmocote fertiliser.

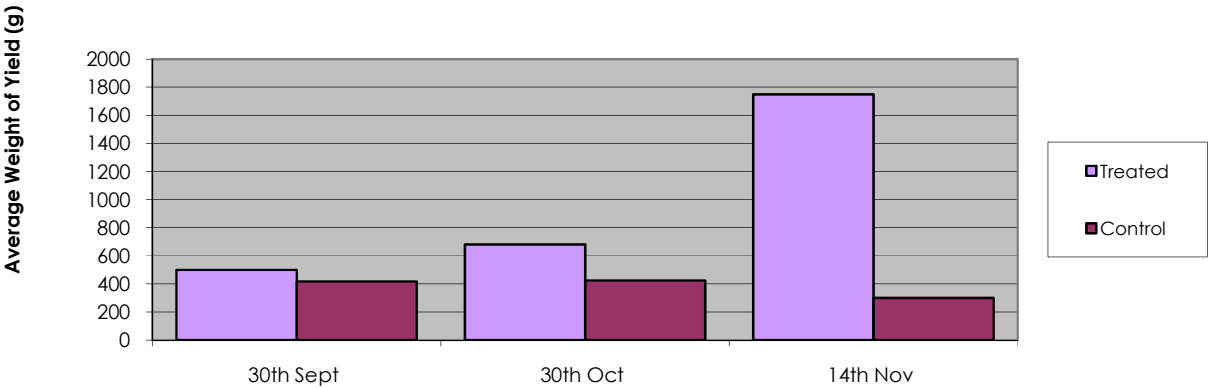

Treated

Control

As can be seen from the photos the control plants are smaller than the treated plants. The control plants leaves were on average 10% smaller and the plants themselves were 15% smaller.

The plants were harvested three times; the results are as follows;

Comparison of Harvest Weights between Treated and Control Plants

The total yield from the control plants was 1143g; the total yield from the treated plants was 2930g. The treated plants produced 61% heavier yield.
